

### Abstract of the Disclosure

Deviant position determining means determines whether or not a vehicle deviated from a set route, detects route deviation information such as a route deviated position when a vehicle deviated, and stores it as past route deviation information in route deviant position storing means. The route searching means searches a route to the destination based on information obtained by position detecting means and map information acquiring means, and past route deviation information obtained from the route deviant position storing means. The route guidance changing means determines whichever route guidance method is the best based on information obtained by the route searching means and from the route deviant position storing means, and instructs a route guidance outputting means.
